

## Announcement of New Development:

### The new drive system for the OMEGA curved platform lift

#### Main features of improved drive system:

The new drive was developed to combine highly aesthetic demands with extremely space saving design. This allows the OMEGA platform lift to be installed at almost all staircases.

Drive box hardly exceeds the edge of the upper step. Given a platform length of 1000mm, the drive can be installed so as **not to exceed the edge** of the upper step (see drawing).

Furthermore the carriage of the platform can park in front of the drive, in order to cover it almost completely in the upper parking.

A motor **potential of up to 1,1 kW** allows the drive to be used at long installations (e.g.: 5 x 180° curves and 20m length), without the need for a bigger drive box.

The drive box can be uncovered while the unit is in use, that gives the possibility to **check on the rope while having the platform in operation**.

Simpler wiring inside the drive box makes **installation easier and less time consuming!**
